Shipping charges do not include Duty, Customs Charges or Taxes which are the responsibility of the buyer. At Easy Spa Parts, Our Goal is to Get You the Information, Parts and Advice You Need to Get Your D1 Spa Fixed as Quickly as Possible. If you have additional questions about hot tub maintenance or repair, just call us and talk to our experienced D1 hot tub technicians for a deeper dive into a particular subject. The most common questions spa owners have are related to flow issues. Other indications are FL1, FL2 or just several flashing lights on the main upper control panel. By reviewing the procedures in the Flow section of our DIY, you can perform the 1st steps in diagnosing the problem. These simple steps can often be performed by spa owners with no aptitude for mechanical repairs. We tailor our instructions to that 1st attempt. Don't be intimidated because you've never tried this before, just dive in and give it a shot. Still struggling to make the diagnosis repair. Contact our experienced Dimension One hot tub service techs for additional assistance. We pride ourselves on being the most knowledgeable, helpful folks available to help D1 hot tub owners. Call us tollfree; 866 4181840. Your Dimension One spa may not be working properly for a number of reasons, including incorrect water temperature or error messages on the display. With a little patience and the right troubleshooting tools, you will be able to get your spa up and running again. If the water is not getting hot enough, there are three possible problems the temperature setting could be too low and need adjustment on the control panel, the filter could be dirty and in need of cleaning, or there is a malfunction in the flow switch, which needs to be serviced by the dealer. If the temperature is too high, the temperature setting could also be to blame, or the high limit setting was tripped. If the latter is the case, call the dealer for assistance. Call the dealer for assistance in fixing the problem. <http://www.pirotechnica.ru/userfiles/cadd-legacy-plus-pump-manual.xml>

We will send you the link or help you find it! We also offer 120v E10 circ pumps that differ based on if barb or threaded E10 120v connection. In addition, they have the Aqua FIT systems swim spa line. First check for the part number on the back of the existing pillow for easy replacement. These are the original replacement pillows. The Amore Bay fits 78 with 62 hydrotherapy jets. Both the Diplomat and Chairman have the same seating capacity, lounge and size as the Californian, but with 48 and 51 jets respectively. This swim spa line has the largest swim spa lane in its class, which can be used for swimming, rowing, lifting soaking or having fun. The AquaFit Sport model is 13 feet long, with either 4 or 6 swim jets but no hydrotherapy seats. The Aqua Fit Pro is 19 feet long with 4 or 6 swim spa jets and a Max Therapy seat with Jet Therapy pillows.

<http://libertad74.com/images/Diagnostico-Rural-Participativo+Manual.pdf>

The Aqua Fit Plus is also 19 feet long, with a dual temperature feature and adjustable hydrotherapy jets. We will answer it fast. Of course, if you are the chatty type, go ahead and use the chat box below or give us a call. We'll respect your privacy and unsubscribe at any time. You're ready to sit back and relax in your bubbling, steamy hot tub. You've got a fresh towel, a cold drink, and a salty snack all ready to go. You remove your hot tub cover, only to find the water is ice cold. Before you panic about what it'll cost to get a repairman to fix your spa on the weekend, try a little DIY hot tub troubleshooting first. Several common hot tub issues have simple solutions you can handle on your own. A hot tub without hot water is just a tub. Narrow down a possible cause by first determining whether your water is staying cold or getting warm, then cooling down. It can help you quickly identify the culprit by testing the electrical components. First, check your water level. Then, look for clogs in your circulation system, and wash or change your filter. While these may seem like mundane solutions, they're also the quickest and least expensive, so always try them first. If the high limit switch shut your heater off because your water got too hot or you have air trapped in your lines, resetting the heater will get it going again. Luckily, fixing an air lock is a fairly easy task. If you're confident in your skills to troubleshoot your hot tub heater, you can remove the heating element and check to see if it looks burnt. If it needs replacing, you'll want to hire a pro unless you're comfortable doing this type of work yourself. Your pump has to be running in order for the spa to heat up. If the pump isn't working, you may need to replace it. If the pump is working, and the heater is on, but the water still won't stay at an even temperature, you may need to replace the heater. Next check your thermostat and heat sensors.

<http://nicolasdrey.com/images/Diagnostico-Rural-Participativo+Manual.pdf>

Your high limit switch has one or two sensors that shut off your heater if the water temperature gets too high. If they're fried, your heater may not operate properly. But maybe wait until Monday so the hourly rate isn't so high. One of the best parts of soaking in a hot tub is using the jets. But if you've got nothing coming out of your jets, don't fret. Also check them for debris such as calcium buildup, and clear them if necessary. Top off the water, clean your filter, and check for plumbing line clogs. If so, you could have air lock. You can turn your jets on and off a few times to try to force the air out. You may also loosen the top fitting on your pump just until you hear air escape and see a bit of water, then tighten it back up. The force of plunging may damage your circulation system. It may

also void your warranty. Then you really will be paying a bunch of money for repairs. Your manual will contain many error codes, but five codes show up most often. If that doesn't help, check to see whether your circulation pump has power going to it. If it does, and it's still not working, it may be time to replace the circulation pump. Its job is to shut off the heater when water pressure is low, so if your water is flowing, but you're still seeing the FLO or FLC error codes, it could be the pressure switch. However, if you're at all unsure, call a pro. Your safety is more important than a quick soak in the hot tub. It means the water is too hot, and may even scald you. The possible causes are plentiful, but you can check a few simple things. If your hot tub is outside, and you've had hot weather, be sure your spa cabinet is staying cool enough to avoid overheating the motor. Check and replace the temperature sensor if needed. If the water isn't hot, but this code is on your display, it's a good idea to call a pro to see what's going on. This commonly occurs when your water level is too low.

Remember to use a hose filter to keep impurities out of your spa and plumbing system. Make sure your circulation system is free of debris before restarting. If the problem persists, call a pro. If, after that period, your water is still cold, try the solutions for when your hot tub won't heat up, such as resetting the heater and checking your sensors and thermostat. In this case, you may need to replace the sensor. If you're uncomfortable working with electronics, call a pro. To learn more about them so you're better able to troubleshoot your hot tub, keep a list of them near your spa. Help is on the way! You'll find it in *The Hot Tub Handbook* and Video Course. Find those problems, and then fix them with ease. This is the guide that hot tub manufacturer doesn't provide you. Clear any clogs from your circulation system. Top off your water. Make sure any valves near your pump are open. You may continue using your pump safely, but the noise will only get worse. First, try lubricating the bearings, but eventually, you'll probably have to replace the circulation pump. Or start using your hot tub with earplugs. A breaker trip is common and usually easy to fix, but any troubleshooting and repairs require you to work with electricity. If you'll be working on it yourself, remember to turn off the breaker before you begin, and be sure you're not touching anything wet. Then turn on the breaker without anything plugged in. If it doesn't trip, plug each item back in one at a time. For each item you reconnect, flip the breaker, then turn on your spa. If your GFCI trips, the component you just reconnected or the wiring to that item is the culprit. Most likely, it's one of four common causes. If you find moisture on or around the breaker, identifying and fixing the source of the moisture may be all you have to do to keep your breaker from tripping. After all, the purpose of the GFCI is to protect you from electric shock around water.

Grab a good flashlight, and inspect all these areas carefully. If you find corrosion, you'll need to replace the damaged parts, or hire a pro to do so for you. Give wires a gentle tug to check their connections. Also keep an eye out for other signs of damage, such as melted or burnt wires. It's simply a component with a finite lifespan. This one of the most common reasons your breaker might trip. Flip the breaker again and see whether it trips. If it doesn't trip, you'll need a new heating element. Regardless of whether it burned out or has a short, you'll still need to replace it. If the water's not moving, you may as well be sitting in your bathtub, right. Luckily, the causes are few, so you should be able to identify the problem pretty quickly. Check the filter for damage. If it looks OK, give it a good cleaning. If it's starting to show signs of wear and tear, consider replacing it entirely. Check the water level to make sure it's where it should be. If it's not, add water, and then run a test to see if the flow returns to normal. If so, the problem is elsewhere. If it isn't, use a multimeter to check whether the pump is receiving power. If it is, but the pump still won't work, it probably needs to be repaired or replaced. If it isn't, you might have a bigger electrical problem on your hands. Not everyone is an electrician, and that's OK. If you aren't comfortable working on these systems, please call a professional. This means air has gotten into the plumbing lines, and is preventing the water from flowing the way it should. Look for small bleed screws at the end of the pump, and open them all to let the air out. Some systems may have a screw on top of the pump as well. In some cases, you

may have to bleed the system more than once to get all the air trapped in your hot tub's system. Also make sure you close bleed screws quickly to prevent water from spraying once the air has escaped.

In this case, check for worn out jet seals, and then check all nozzles for any debris that could be blocking the flow of water. Check the wet end of your pump to see if something is blocking the water flow or to see if you have a broken propeller. In some cases, the valves connecting the ozonator to your hot tub can begin to wear out or can become blocked by debris. Clean them out or replace them, and then test the system to see if the water flow returns to normal. If not, you may need to replace the ozonator. You'll need to occasionally replace parts through no fault of your own. But you can avoid some of the most common problems by taking proper care of your spa. Adding a little water and cleaning your filter can go a long way toward fixing a lot of hot tub bad behaviors. Getting a problem fixed correctly the first time can save you a lot of headaches—and money—down the road. And each year, he continues to help more people with water chemistry, cleaning, and troubleshooting. This is the guide that hot tub manufacturer doesn't provide you. Well respect your privacy and unsubscribe at any time. Could be a fluke. Or it could be one of these seven things. Identifying the problem is the key to fixing it. All you need is a new blower and about half an hour. Its inevitable and unavoidable. Its also easy to fix. Well, it will be after you read this. It is the chip that drives the board and gives it its unique functions. To correctly identify a circuit board the chip number should be used to identify it. Locate the chip on your circuit board and match it to one of the chip numbers shown. Newer revisions usually indicate an upgrade or improvement. You will always receive the newest revision if available. Remember do not order a circuit board based on looks, the chip number must match the number on your board in order for you to get the correct board. We repair circuit boards for more info [click here](#) We will be back soon.

See reviews below to learn more or submit your own review. Enjoy reading our tips and recommendations. Unsubscribe at any time. Its location on this page may change next time you visit. It is still running but I have had to replace both pumps, the control panel 3 times and all of the jets which go yellow with age. I now have a leak and it is virtually impossible to get the parts I need to fix it. I would never buy an American made product again without the local support to provide warranty and maintenance. Dimension One make no effort to support customers outside of the US and Canada so cannot recommend the company even though the hot tub is great and has been working for almost 20 years. Enjoy reading our tips and recommendations. Unsubscribe at any time. Rhonda of Larue, TX Distributors of this product do not give any instructions at delivery. They order it, and drop it at your home and leave. Let you know that the manual is behind the panel, tell you to get your electrical done, fill it and you should be good to go. So DO NOT buy unless you already have experience with a spa, because you will not get any help. Very poor design to get to the motor, pump and hoses. You have to take the front panel off, which is very difficult to put back on. Another really bad aspect is, if it is hot outside the water will heat to over 107 and you cant ever use the spa during the summer. We set the temp to 58 degree and it did not matter. I was told that due to the installation and that there is no cooling system, that if it is hot outside the spa will heat to very hot, just leave the lid off to help or continue to drain out the hot water and cool down with the hose by adding cold water. This spa is also very hard to step down into because there is no level spot with the way that the seats are arranged. This makes it very easy to slip and fall, so be careful This is our 1st spa to buy and I would never buy another.

This has been a nightmare of an experience, that I wish I had never done. We found out that the Dimension One logo in our hot tub was installed wrong when we purchased the hot tub and for 10 years when we asked about why when we filled the hot tub it would drop down below the logo that it was normal. Find out that the water was seeping thru these holes and have completely rotted our hot tub away. They dont stand behind their product and wont make it right with our hot tub!!! The problem I have is my 1993 Spa is still working. I live in Canada and bought it when I was in the

Military and it has moved to 8 different locations in Canada and still works great. At 25 years I have of course changed out a few things over time; like 3 covers, 1 pump, air billows and a few jets but that is it. I am definitely extremely happy with my purchase long ago and all my friends and family can't believe it is still running. I have followed the suggested maintenance program consistently. I have turn the spa off only when changing the water since I have owned it. Myself and my wife especially love to use the year round but in January I discovered a loss of water and a leak somewhere in the plumbing, I've had to add water every 34 days. I contacted the place I purchased the Spa and they referred me to a service company that has sent a repairman out twice to diagnose the problem. The last visit was 1 month ago. He said he had to order the parts and since then he no longer works for the repair company. The parts were due in last week according to the repair company. I reached out again to see when they would be out and still no answer. I also tried to contact Dimension One via phone and internet and never got a response. I think that I made a huge mistake deciding on Dimension One. I should have gone with the Jacuzzi brand equivalent that I considered in the first place. If I dont hear from the repair company soon then Im going to take legal action.

I now have had it for three years and it is wonderful spa. I had to replace the motherboard and was easy repair for me. I keep the two filters clean once a week remove and flush with sprayer hose. I dont like chemicals like chlorine or acid. I researched and found Clarity Waters look them up in San Diego CA., the owner will tell you all you need to know!! Incredible find, make sure you research because I believe when use harsh chemicals it breaks down the components in the spa quicker. I use a potassium shock. Its the best price I found. Good luck and happy Spaing. The only problem I had in all that time was the connection inside the filter chamber to which the black filter lock thing attaches. It was quickly replaced under warranty and has not been a problem since. After five years there, we moved to a rental house in a better school district while we looked for a permanent home. We paid to have the hot tub moved and installed there, then six months later we moved to our new home where we again paid to have it moved. Through both moves it continued to operate normally. The hot tub would intermittently stop heating and display the 32 error message. As winter turned to spring, it was heating less and less and soon started turning the pump on and off over and over. We paid to have the thermostat replaced and the problem went away. Summer was upon us by now so we decided to drain the hot tub and revisit it closer to fall. This November brought a sudden temperature drop and we were missing our hot tub time. I called a hot tub shop and they told me the lower control pack had to be replaced. I ordered a new pack from Easy Spa Parts and the swap was no big deal. It took about 1.5 hours and I started filling the hot tub. Everything checked out and were back in business. One of the best things about this hot tub is that the shell does not stain very easily. Leaves, dirt, and so forth always manages to sneak under the cover.

When we drain it for the summer it inevitably fills with dust, dirt, bugs, snails, and other. things. All I have to do is hose it out and scrub it down with a 3M sponge and its back to new again. The only real negative thing Id say about the hot tub is really not D1s fault. This model came out right before the Virginia Graeme Baker Act, and as a result the Pentairstyle suction drain covers could no longer be manufactured by law. Now three of the drain covers are partially broken and one is missing entirely. If you want to get those old ones covered back up you have to hope that someone in another country sells them or juryrig the new models onto the old mounts. My experience with this hot tub has been overwhelmingly positive. As long as you take care of it just a little bit it will still work and look like new for a long time. As Ive found, replacing most parts is not too hard if youve got some handyman chops. Now that Ive replaced the lower control pack and the headrests it not only works like new but looks great. Maybe not a literally brand new one, but for an almost 11yearold hot tub it cant be beat. Im sure its going to keep working for another 11 years at least. The best part of our D1 that the hot tub has become the place where we solve all the problems of the world. The heat, the relaxation, the sound of the bubbles, it all makes the gears turn. I cant imagine not having a hot tub

in our backyard and I feel sorry for people with inferior ones. I see so many others with rotting hulks decaying in their backyard, all wishing they could be using it. I've never worried about that with our D1. It has tons of power and the lounge fits me perfectly. I like the fact that I do not have to fit to keep myself in the set. The headrest that moves up and down is great for our family. I would highly recommend a Dimension One Spa! Had problems with leaks, motherboard and finally heater all last summer.

Ordered and paid for a new one last August, apparently my hot tub needs a Fast Flo heater and none were in stock. I started calling in March again and was told still on back order it's now mid May. Called the manufacturer, left messages NO RESPONSE. Jacuzzi apparently owns Dimension One called there, NO RESPONSE. I just don't understand how this heater isn't yet in stock it's there only one manufacturer in the ENTIRE world that makes this heater. Never again! As you know this is a unique and patented heater for our product. We have switched manufacturers of this unit last year and thought we would have this unit by now for any customer. Our latest updates stated that we should have it available by the end of May. Please call your local D1 Dealer or EZ Spa Parts online to check the status of ordering the replacement heater for your spa. Shells are constructed from acrylic and impact resistant thermoplastics. Choose from EnviroTect synthetic cabinet or three different colors of exterior wood.
